                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Alignment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to a sequence capable off binding specifically to a CDIO9 nucleic acid which has a single nucleotide polymorphism that distinguishes the Gova and Govb alleles. Detection of the Gov genotype is useful for detecting whether the subject has or is at risk of a blood disease, disorder or abnormal physical state, such as bleeding, or increased risk of bleeding, due to alloimmune destruction of blood platelets, e.g., post-transfusion purpura, post-transfusion plattelet refractoriness or neonatal alloimmune thrombocytopenia. The nucleic acid and polypeptide are useful for Gov genotyping or phenotyping individuals. The present sequence is the Govb coding sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated oligonucleotide binding to a region of CD109 nucleic acid having a single nucleotide polymorphism that distinguishes a Gova and/or Govb allele, useful for treating blood disorders e.g. alloimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   thrombocytopenia

New CD109 nucleic acids and polypeptides, useful in gene therapy, particularly for treating strokes, myocardial infarctions, thrombosis, thrombocytopenia, autoimmune diseases, or organ or bone marrow
```

Claim 1; Fig 1b; 156pp; English.

CC The invention relates to isolated nucleic acid molecules encoding CD109 CC polypeptides. These nucleic acid molecules include the human cDNA CC sequences comprising CD109 K1, CD109 K1-H7, CD109 K15 or their variants. CC CD109 is a novel member of the alpha2 macroglobulin (alpha2M)/C3, C4, C5 CC family of thioester-containing proteins. The CD109 polypeptides can be CC expressed by standard recombinant methodology. The CD109 nucleic acid, CC CD109 polypeptide or its mimetic, or the anti-CD109 antibody is useful CC for treating or detecting a disease or disorder, e.g. conditions associated with endothelial activation, platelet activation, activation of the coagulation or fibrinolytic systems, activation of T lymphocytes and of the complement system, quantitative or qualitative abnormalities CC of platelet function, increased or impaired platelet aggregation and CC activation, increased or impaired activation of the coagulation and/or CC fibrinolytic systems, or impaired activation of the coagulation and/or CC fibrinolytic systems, or impaired activation of the coagulation and/or CC transplantation, or bone marow transplantation. The CD109 nucleic acids or their antisense nucleotide sequence are useful in gene therapy for treating these conditions. The present sequence represents the human CC CD109 KI variant CDNA sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         for treating or detecting a disease or disorder, e.g. conditions associated with endothelial activation, platelet activation, activation of the coagulation or fibrinolytic systems, activation of Tlymphocytes and of the complement system, quantitative or qualitative abnormalities of platelet function, increased or impaired platelet aggregation and activation, increased or impaired activation of the coagulation and/or fibrinolytic systems, or impaired or increased immune activation. These are also useful for treating cardiovascular disorders, stroke, myocardial infarction, thrombosis, embolism, peripheral vascular disease, thrombocytopenia, thrombocythemia, autoimmune diseases, organ transplantation, or bone marrow transplantation. The CD109 mucleic acids or their antisense nucleotide sequence are useful in gene therapy for treating these conditions. The present sequence represents the human CD109 K1-H7 variant CDNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to isolated nucleic acid molecules encoding CD109 polypeptides. These nucleic acid molecules include the human cDNA sequences comprising CD109 K1. CD109 K1-H7, CD109 K15 or their variants. CD109 is a novel member of the alpha2 macroglobulin (alpha2M)/C3, C4, C5 family of thioester-containing proteins. The CD109 polypeptides can be expressed by standard recombinant methodology. The CD109 nucleic acid, CD109 polypeptide or its mimetic, or the anti-CD109 antibody is useful for treating or detecting a disease or disorder, e.g. conditions
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New CD109 nucleic acids and polypeptides, useful in gene therapy, particularly for treating strokes, myocardial infarctions, thrombosis, thrombocytopenia, autoimmune diseases, or organ or bone marrow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 5895

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Secretory proteins play important roles in the proliferation control, the differentiation induction, the material transport and the biophylaxis of cells. Membrane proteins have important roles as signal receptors, ion channels and transporters. The present sequence is the coding sequence for a human protein which has at least one hydrophobic domain. The protein encoded by the present sequence may be a secretory or a membrane protein. The encoded protein may have cytokine and cell proliferation/differentiation activity, insue growth activity, activity, haematopoiesis activity, tissue growth activity, haematopoiesis activity, tissue growth activity, haematopoiesis activity, activity activity and tumour inhibition activity. The present sequence could therefore be used for treatment of autoimmune disease, Alzheimer's disease, Parkinson's disease, and cancer via gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            17-NOV-1998;

                                                                                                                                                                                                                                                                                                                                                       Local Similarity:
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Secretory proteins play important roles in the proliferation control, the differentiation induction, the material transport and the biophylaxis of cells. Membrane proteins have important roles as signal receptors, ion channels and transporters. The present sequence is the coding sequence for a human protein which has at least one hydrophobic domain. The protein encoded by the present sequence may be a secretory or a membrane protein. The encoded protein may have cytokine and cell proliferation/differentiation activity, immune stimulating or suppressing activity, haematopoiesis activity, tissue growth activity, haematopoiesis activity, tissue growth activity, haematopoiesis activity, anti-inflammatory activity and tumour inhibition activity. The present sequence could therefore be used for treatment of autoimmune disease, Alzheimer's disease, Parkinson's disease, and cancer via gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Proteins comprising hydrophobic regions, such as secretory and membrane proteins, useful in research and diagnostics and having various activities e.g. immunomodulatory, antiinflammatory, chemokinetic, hemostatic, thrombolytic -

                                                                        The invention relates to novel transforming growth factor (TGF)-betal binding reagent which comprises a glycosylphosphatidyl inositol (GPI)-anchored TGF-betal binding protein referred to as r150 which acts as an accessory receptor of TGF-beta. The invention is used for negatively modulating TGF-beta activity, and thus for treating conditions characterised by overproduction of TGF-beta, such as cancer. Antisense molecules of the invention are used for increasing TGF-beta availability and increase graft success. The present sequence is human blood cell surface antigen, CD109 encoding DNA. CD109 is a variant of r150 sequence.
                                                                                                                                                                                                                                                                                               Novel transforming growth factor (TGF)-beta 1 binding reagent which comprises r150 protein which acts as accessory receptor of TGF-beta, useful for negatively modulating TGF-beta activity, and thus for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to novel transforming growth factor (TGF)-betal binding reagent which comprises a glycosylphosphatidyl inositol (GPI)-anchored TGF-betal binding protein referred to as r150 which acts as an accessory receptor of TGF-beta. The invention is used for negatively modulating TGF-beta activity, and thus for treating conditions characterised by overproduction of TGF-beta, such as cancer. Antisense molecules of the invention are used for increasing TGF-beta availability and increase graft success. The present sequence is human r150 protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel transforming growth factor (TGF)-beta 1 binding reagent which comprises r150 protein which acts as accessory receptor of TGF-beta, useful for negatively modulating TGF-beta activity, and thus for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S
                                         The invention relates to isolated nucleic acid molecules encoding CD109 polypeptides. These nucleic acid molecules include the human cDNA sequences comprising CD109 K1. CD109 K1.-H7, CD109 K15 or their variants. CD109 is a novel member of the alpha2 macroglobulin (alpha2M)/C3, C4, C5 CD109 is a novel member of the alpha2 macroglobulin (alpha2M)/C3, C4, C5 can be carparented by standard recombinant methodology. The CD109 nucleic acid, CD109 polypeptide or its mimetic, or the anti-CD109 antibody is useful
                                                                                                                                                                                                      New CD109 nucleic acids and polypeptides, useful in gene therapy, particularly for treating strokes, myocardial infarctions, thrombosis, thrombocytopenia, autoimmune diseases, or organ or bone marrow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CD109; alpha2 macroglobulin; thioester; cerebroprotective; cardiant; immunosuppressive; haemostatic; anticoagulant; thrombolytic; human; cardiovascular; vasotropic; gene therapy; CD109 K15; gene; ss.
for treating or detecting a disease or disorder, e.g. conditions associated with endothelial activation, platelet activation, activation of the coagulation or fibrinolytic systems, activation of T lymphocytes
                                                                                                                                                                                                                                                                                                                Schuh A,

These are also useful for treating cardiovascular disorders, stroke, myocardial infarction, thrombosis, embolism, peripheral vascular disease, thrombocytopenia, thrombocythemia, autoimmune diseases, organ transplantation, or bone marrow transplantation. The CD109 nucleic acids or their antisense nucleotide sequence are useful in gene therapy for treating these conditions. The present sequence represents the human CD109 KIS CDNA sequence.

The invention relates to isolated nucleic acid molecules encoding CD109 polypeptides. These nucleic acid molecules include the human cDNA sequences comprising CD109 K1, CD109 K1-H7, CD109 K15 or their variants. CD109 is a novel member of the alpha2 macroglobulin (alpha2M)/C3, C4, C5 family of thioester-containing proteins. The CD109 polypeptides can be expressed by standard recombinant methodology. The CD109 nucleic acid, CD109 polypeptide or its mimetic, or the anti-CD109 antibody is useful for treating or detecting a disease or disorder, e.g. conditions
                                                                                                                                                                                                                                                                                                                                                                 New CD109 nucleic acids and polypeptides, useful in gene therapy, particularly for treating strokes, myocardial infarctions, thrombosis, thrombocytopenia, autoimmune diseases, or organ or bone marrow transplantation -
                                                                                                                                                                                                                                                                                                 Claim 1; Fig 4b; 156pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       07-MAR-2001; 2001US-273814P

                                                                             associated with endothelial activation, platelet activation, activation of the coagulation or fibrinolytic systems, activation of Tymphocytes and of the complement system, quantitative or qualitative abnormalities of platelet function, increased or impaired platelet aggregation and activation, increased or impaired activation of the coagulation and/or fibrinolytic systems, or impaired activation of the coagulation and/or fibrinolytic systems, or impaired or increased immune activation. These are also useful for treating cardiovascular disorders, stroke, myocardial infarction, thrombosis, embolism, peripheral vascular disease, thrombocytopenia, thrombocythemia, autoimmune diseases, organ transplantation, or bone marrow transplantation. The CD109 nucleic acids or their antisense nucleotide sequence are useful in gene therapy for treating these conditions. The present sequence represents the human
  Sequence 3535
                                                        K15 variant cDNA sequence.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
